

Thanks for your interest in joining the team. This challenge is intentionally short.

Time Expectation

Please spend less than 1 hour (Feel free to use any AI tool you want).

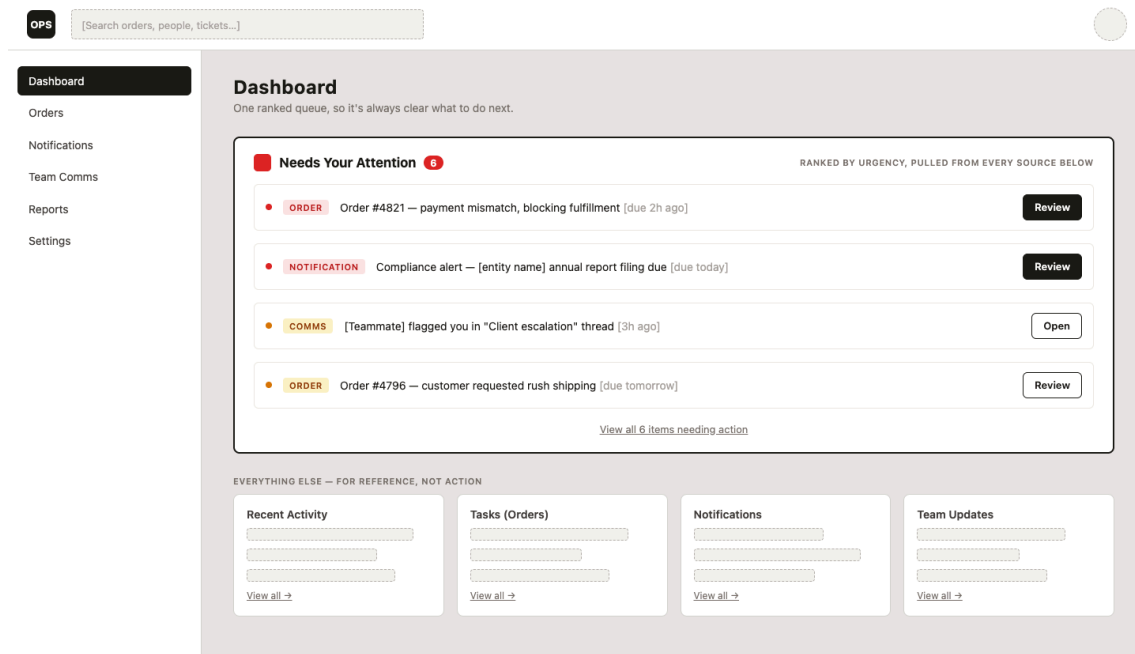

We'll mainly look for: Product thinking and UX reasoning. We want to understand how you think, prioritize, and communicate product decisions.

Context

You're working at Amazon on an internal operations application used by the fulfillment team to manage and coordinate their daily workflows.

Currently, the dashboard shows:

- Recent activity /Tasks (Orders) /Notifications /Team updates (Internal Comms)

A frequent complaint from users is:

"I never know what needs my attention first." because the users feel overwhelmed and miss important actions. And the Managers complains "I cannot see what each workers are doing"

Your Challenge

Redesign the dashboard experience to help users quickly identify the priority of the individual work from most critical to least urgent.

What to Deliver

1. Your thought process

A short explanation (bullet points are fine):

What problem are you solving? / What assumptions are you making? / What did you prioritize and why?

2. Low-fidelity or Wireframes solution

This can be: Wireframes, Simple UI screens, Flow sketches, or Figma frames.
